

E1 math-391 / step 2

gold: Lean $P(\text{Lean}) = 54.0\%$ margin = +0.16

... However, since we need the three people to sit consecutively, we're essentially looking for the number of ways to place two markers between these 7 positions (since once the first marker is placed, the second marker will determine the third person). This ...

E2 math-970 / step 3

gold: Python $P(\text{Lean}) = 1.3\%$ margin = -4.37

So, the numerical value of the expression is: $\boxed{15}$

Attribution to the routing margin (logits): orange → Python · blue → Lean
